SUMMARY

Software Engineer with a track record of scaling backend systems and integrations, including cutting core runtime by 95%+, architecting a provider-agnostic calendar integration layer, and contributing engineering work behind a $100M acquisition by DoorDash. Proficient in Python, Django, TypeScript, React, Node.js, and Google Cloud Platform.

EXPERIENCE

Senior Software Engineer *April 2024 - August 2026*
Synapsa *Cold Spring, KY*

- Eliminated database deadlocks by enforcing consistent query ordering, wrapping critical operations in explicit locks and transactions, and moving reads out of nested loops into function setup, hardening platform reliability.
- Built and owned integrations with third-party CRMs, meeting-recording software, messaging systems, and lead-intelligence tools.
- Designed a provider-agnostic calendar integration layer with webhook subscriptions, push-notification-based sync, and subscription lifecycle management.
- Built the project's test suite (500+ tests, ~70% coverage) and improved logging traceability, cutting incident diagnosis time from hours to minutes.
- Cut runtime by 95%+ for core functions and built a new developer platform: a public REST API and a user-facing MCP server.
- Scaled outbound lead engagement from a <10 limit to mass CSV/CRM-export/webhook-based bulk ingestion.

Software Engineer *January 2023 - September 2023*
Passthrough *Cold Spring, KY*

- Implemented site-wide redesign, upgrading the design library and building reusable base components for the customer-facing product.
- Built API endpoints for investment firms and designed an organization permission system and go-live workflow for fund managers.
- Created investor-onboarding validation and managed multiple parallel deployments using Google Cloud Platform.

Software Engineer *January 2021 - December 2022*
DoorDash (formerly Bbot) *Cold Spring, KY*

- Integrated Bbot's Order-And-Pay product with other companies' products, including third-party delivery, reservations, and rewards.
- Designed high-demand features for high-value restaurants, such as Multivendor Delivery for food halls and Loyalty Integration webhooks.
- Refactored core codebase features with supporting Django migrations; directly contributed to the $100M DoorDash acquisition as part of a two-engineer API/integrations team.

Software Engineer *January 2017 - December 2020*
Siemens *Milford, OH*

- Maintained and enhanced global infrastructure of 400+ servers protecting company assets from malware and intrusions, using Puppet, Linux, and Elasticsearch.
- Built the UI analysts used to search and investigate security alerts, and a system translating in-house search syntax to Elasticsearch and other analytics syntaxes.
- Developed malware/intrusion detection scripts processing petabytes of data daily, and mentored new employees on infrastructure and development processes.

PROJECTS

Portfolio Website | *github.com/AndrewBezold/personal_webpage/*

- Personal website (a resume in a different form) built with TypeScript/React (Mantine) and a TypeScript/Node backend.

Shosetsu | *gitlab.com/shosetsuorg/shosetsu/*

- Kotlin Android app for reading webnovels; contributing features and bug fixes.

Numerai | *github.com/AndrewBezold/numerai/*

- Built ML models in Python plus a webhook-driven webserver and retraining infrastructure for a recurring AI contest; webserver open-sourced, models withheld.

EDUCATION

BS, Computer Engineering/Computer Science | University of Louisville • Louisville, KY • December 2015

CERTIFICATIONS

PCEP-30-02 (Certified Entry-Level Python Programmer) • PCAP-31-03 (Certified Associate in Python Programming)

SKILLS

Python, Django, JavaScript, TypeScript, React, Node.js, Kotlin, Go, PostgreSQL, Google Cloud Platform, Linux, Puppet, Elasticsearch, Git
